

Graphics of Asteroid occultation observations.

2018 March

Introduction

The following graphics plot the 302 best observed Asteroid occultations (which is about 8% of all observed Asteroid occultation events).

The plots have a filename convention concatenating the asteroid number, asteroid name or provisional designation, and occultation date.

The heading for each plot gives the following information:

Line 1

Object identification, event date, ellipse size and orientation, and associated uncertainties.

Line 2

The offset of the shadow from the center of the earth, and associated uncertainty values.

Line 3 [Only when a double star is involved.]

The separation and Position angle of the components of the double star, with associated uncertainty.

Important. In all lines, an uncertainty value is only given if there has been a meaningful calculation of the particular quantity. Where there is no uncertainty value, usually the particular value has been assumed.

The coding used in the plots is as follows:

Event type

- * Disappearance events are plotted as red points.
- * Reappearance events are plotted as green points.
- * Miss events are plotted as grey lines.
- * For some events, the predicted central path is plotted. This is drawn using a purple dashed line.

Observing method

- * Events recorded visually are plotted with a '+'
- * Video/CCD observations are plotted with a small square.
- * Miss events are plotted with a 'x'.

Plot style

The plot is drawn in a manner that depends on the detail that is derived from the observations.

- * For the best-observed events, the observations are drawn without any best-fit ellipse, or joining pairs of observations. This better enables the irregularities in the asteroid profile to be visible.
- * For well-observed events, a best-fit ellipse is drawn through the observations. The ellipse illustrates the shape of the asteroid.
- * For poorly-observed events, a gray line joins the events of each observer. That is, it shows the time during which the star was invisible to the observer.

Note: In a few cases, if the observed chord indicates that the diameter of the asteroid was larger than expected, a plot with only a single chord may show a circle fitted to the ends of the chord. Ordinarily a fit will not be made to a single chord.

Double stars

For a small number of events, a double star is involved. When this occurs, the plot includes a representation of the double star, drawn on the same projected scale as the plot of the asteroid.
